Day ~~37~~ Left – NET 2021

45 days

MHSET- 26 SEP 2021

The **schedule of UGC-NET June 2021** is as follows:

June 2021

Online registration and submission of Application Form (complete in all respect) through NTA Website: https://ugcnet.nta.nic.in	10 August to 05 September, 2021 (upto 11:50 pm)
Last date for successful transaction of Examination fee	06 September, 2021 (upto 11:50 pm)
Correction in the Particulars in the Application Form (online only)	07 September to 12 September, 2021
Downloading of Admit Card from NTA Website	To be announced later on website
Dates of Examination	06 October to 11 October 2021
Timing of Examination	First Shift: 09.00 am to 12.00 pm
	Second Shift: 03.00 pm to 06.00 pm
Website	ugcnet.nta.nic.in , www.nta.ac.in

Big data

INTRODUCTION OF HADOOP

- Hadoop is an open source framework. It is provided by Apache to process and analyze very huge volume of data. It is written in Java and currently used by Google, Facebook, LinkedIn, Yahoo, Twitter etc.
- Hadoop tutorial includes all topics of Big Data Hadoop with HDFS, MapReduce, Yarn, Hive, HBase, Pig, Sqoop etc.

MODULES OF HADOOP

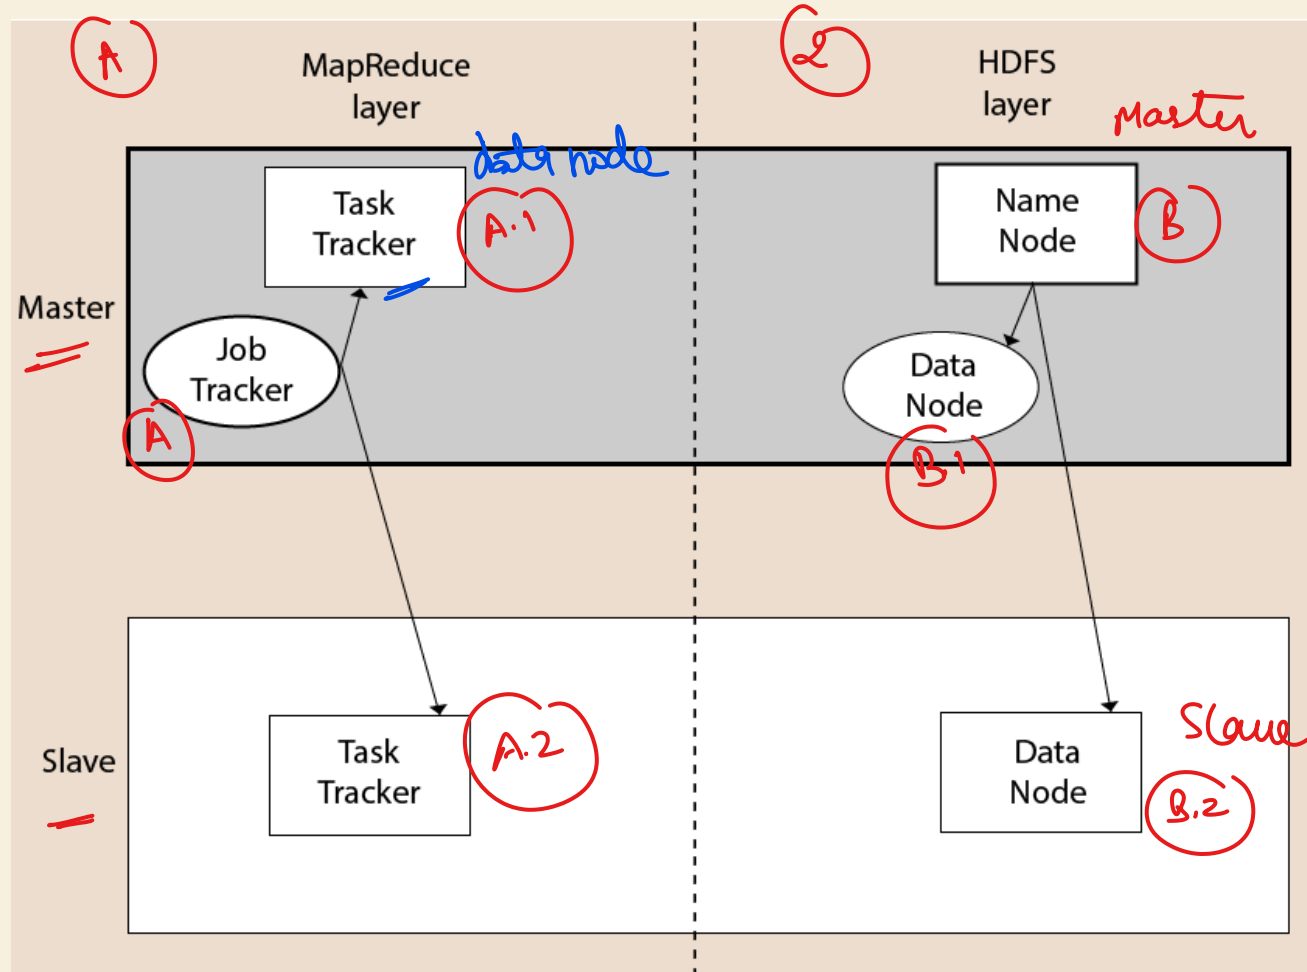

- ✓ **HDFS:** Hadoop ^{असंयुक्त} Distributed File System. Google published its paper GFS and on the basis of that HDFS was developed. It states that the files will be broken into blocks and stored in nodes over the distributed architecture.
- ✓ **Yarn:** Yet ^{असंयुक्त} another Resource Negotiator is used for job scheduling and manage the cluster.
- ✓ **Map Reduce:** This is a framework which helps Java programs to do the parallel computation on data using key value pair. The Map task takes input data and converts it into a data set which can be computed in Key value pair. The output of Map task is consumed by reduce task and then the out of reducer gives the desired result.
- ✓ **Hadoop Common:** These Java libraries are used to start Hadoop and are used by other Hadoop modules.

Hadoop Distributed File System

- The Hadoop Distributed File System (HDFS) is a distributed file system for Hadoop. It contains a master/slave architecture. This architecture consist of a single Name Node performs the role of master, and multiple Data Nodes performs the role of a slave.
- The Java language is used to develop HDFS. So any machine that supports Java language can easily run the Name Node and Data Node software.

Name Node (Properties)

1. It is a single master server exist in the HDFS cluster.
2. As it is a single node, it may become the reason of single point failure.
3. It manages the file system namespace by executing an operation like the opening, renaming and closing the files.
4. It simplifies the architecture of the system.

Rasmi Prabha The Extra Step
CombineCS

Data Node

1. The HDFS cluster contains multiple Data Nodes.
2. Each Data Node contains multiple data blocks.
3. These data blocks are used to store data.
4. It is the responsibility of Data Node to read and write requests from the file system's clients.
5. It performs block creation, deletion, and replication upon instruction from the Name Node.

Job Tracker (Master → name node)

1. The role of Job Tracker is to accept the MapReduce jobs from client and process the data by using Name Node.
2. In response, Name Node provides metadata to Job Tracker.

Task Tracker (Slave → data node)

1. It works as a slave node for Job Tracker.
2. It receives task and code from Job Tracker and applies that code on the file. This process can also be called as a Mapper. *Question*

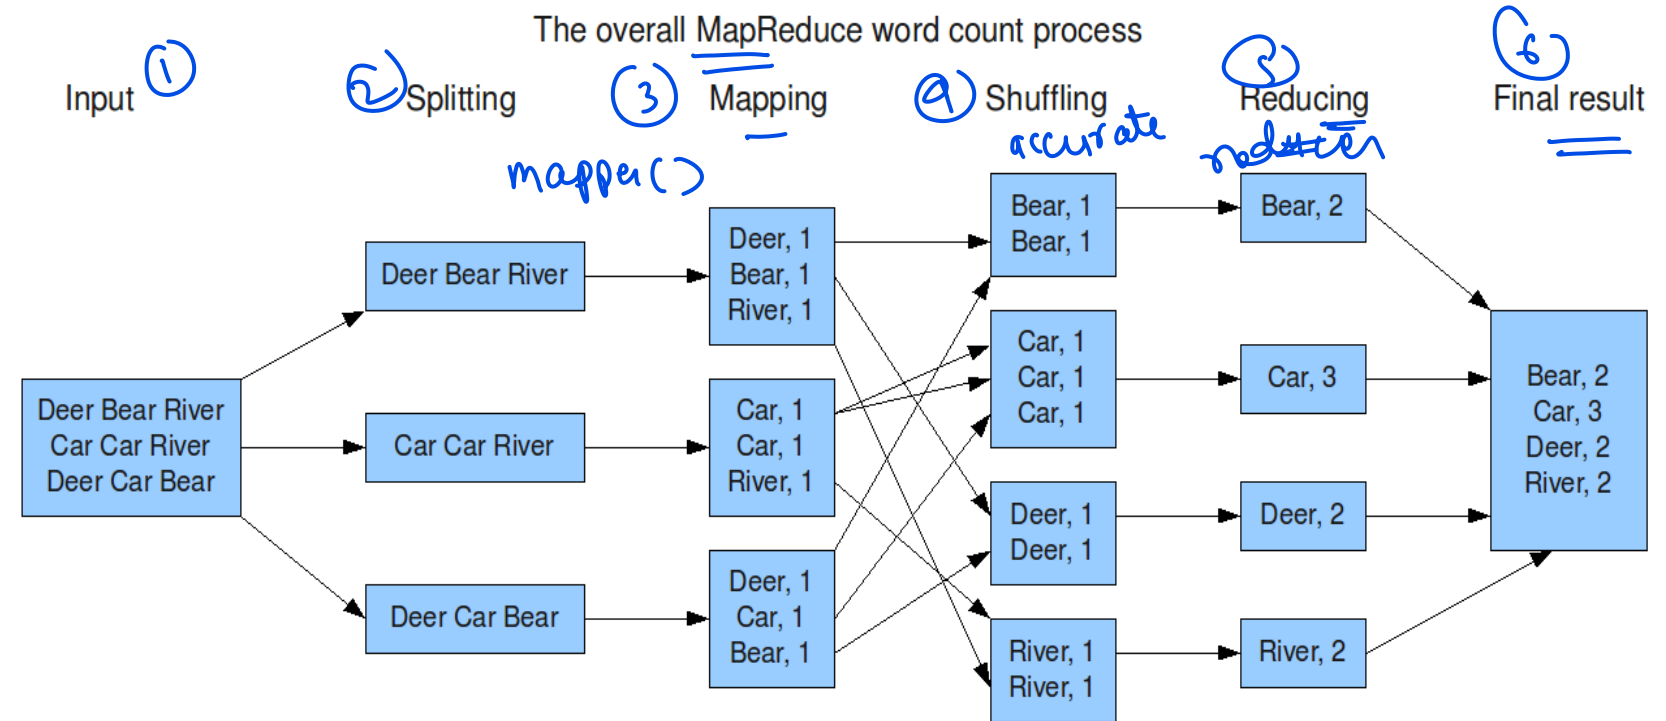

Job Tracker
assign ↓ task
task manager

MapReduce Layer

- The MapReduce comes into existence when the client application submits the MapReduce job to Job Tracker. In response, the Job Tracker sends the request to the appropriate Task Trackers. Sometimes, the Task Tracker fails or time out. In such a case, that part of the job is rescheduled.
